

The Ambivalences of Success: Discourses on Development, Progress, and Extractivism

Fausto A.P. Ignatov Vinueza

In 2007, the Ecuadorian government, under the Presidency of Rafael Correa, made a groundbreaking proposal to the international community. The Ecuadorian State was willing to impose a permanent ban on oil drilling in the Yasuní National Park. The Yasuní-ITT (Ischpingo-Tiputini-Tambococha) initiative would not only promote conservation in one of the most biodiverse regions on Earth; it would leave 856 million barrels' worth of oil underground, preventing the release of about 407 million metric tons of CO₂ into the atmosphere. All this in exchange for 3.6 billion USD— half the value of the oil reserves—to be raised from public and private contributions from the international community. However, after six years of campaigning and advertising, the government terminated the initiative owing to inadequate financial results.

The Yasuní-ITT Initiative sparked a politically aggressive national debate on the productive future of a country on the verge of a post-extractivist economic catastrophe, and worldwide controversy. Although the initiative was ultimately unsuccessful, with its proposal, Ecuador opened an ongoing discussion about concepts like “development,” “growth,” “progress,” and “success.” These are not only meaningful terms to describe and analyze the societies we live in; they are also part of powerful discourses governing our ways of living, individually and collectively, locally and globally. We all have notions of what a successful society looks like, but at the same time there are no concrete qualities or standards that can render our approaches any less vague.

This project focuses on (neo-) extractivism, a set of policies and practices aimed to further the exploitation (often at any cost) of available natural resources. I will consider the economic, social, political, environmental, and cultural implications of the conditions in countries where extractivist practices account for a large portion of the national income.

The goal of this project isn't to describe the right pathway to success, but rather to deconstruct the notion of success at its very core. Questioning the role and meaning of the above-mentioned concepts, I aim to reveal the dominant discourses on how societies think they should act in order to achieve a certain status. How does a society build its understanding of success and development? How is this understanding reproduced? How does it influence other aspects of societal life?

To address these questions, this project combines theories of development, extractivism, and discourse analysis. In addition I will also consider social and technical practices. To understand the extent of such discourses and their implications, it is crucial to scrutinize actual oil extraction practices, their impacts on the environment and society, and the role of politics and economics. Only through an integral understanding of the technical, political, and economic practicalities is a reasonable analysis of the social outcomes and mechanisms possible.

Ultimately, this project seeks to gain an insight into the construction and reproduction of such discourses, taking into consideration more recent developments like the Yasuní-ITT Initiative. However, it will also take into account Ecuador's environmental, economic, and political history and its implications, thus allowing us to assess the Ecuadorian case within the framework of a regional and international comparison.
